Ηi,
   My module has two phases: 1) name translation 2) request handling.
   In the name translation phase, I store something in the request rec
structure by adding a name-value pair to subprocess_env table of the
request_rec.
    Then I retrieve it in the request handler function using
table_get(r->subprocess_env).
    Now the problem I face is that I get the bus error as below and
apache subprocess is crashing. Loading the core into dbx causes dbx
itself to crash. What am I doing wrong?
[Mon Feb 17 15:14:32 2003] [alert] (9) before setting
name_trans_lbplugin_ptr ..
[Mon Feb 17 15:14:32 2003] [alert] (9) after setting
name_trans_lbplugin_ptr ..
[Mon Feb 17 15:14:33 2003] [notice] child pid 2434 exit signal Bus Error
(10)
    (NOTE: I also tried adding to request_rec->notes and
request_rec->request_config but the result was same)
thanks,
K.Srinivasan
